

## Manlift Certification Ottawa

Manlift Certification Ottawa - The Elevated Platforms and Manlifts Certification program helps to provide the required training on the work practices, safe operating procedures, rules and regulations regarding the daily activities for the operators of this equipment. The course has been designed for individuals who are actively involved in these activities or those who have a basic understanding of this machine.

Aerial platforms and manlifts have become integral and common machines in industrial settings in the last few decades. These machinery provide an easy way to lift staff close to what should be done on a stable platform apparatus, enabling employees to carry out tasks with greater comfort and safety rather than being perched on top of scaffolding or ladders.

The manlift is like other industrial devices in that they are safe when used correctly. As they lift employees above floor or ground level, accidents can easily take place and this could result in serious injuries or death for both the manlift operators and whoever passerby who might not be lucky enough to be standing below.

There are various models of manlifts. Most fall into 1 of 2 categories: the articulating boom lift, that has the capability of both vertical and horizontal movement and the scissors lift, that is capable of moving upward and downward.

### Protecting Staff

Proper training is essential when it comes to safety matters. Many of the companies that rent manlifts would provide training at the jobsite. Each and every worker who will be working on the equipment or operating it should receive training in safe operations. It is likewise essential that only those workers who have received training must be authorized to operate the controls. Operating procedures and communication rules should be clear. Therefore, workers on the ground should not operate controls without the knowledge and approval of any staff inside the basket.

The workers that occupy the basket would be required to wear the correct fall protection gear which comprises a harness and lanyard. The fall protection connects to the manlift easily. The employee must ensure that she or he has made whichever adjustments required to reflect the change in fall distance if there are changes in the height of the work area.

Manlifts need to be inspected and tested each day to make certain they are in safe operating condition. Prior to the equipment being used, whatever defects must be re-checked and repaired.
