2. Capacity
Capacity, new features and performance have been added or enhanced since their first introduction. Nowadays, there are maintenance function platform lifts obtainable today that have a capacity to handle four thousand pounds and have height ranges up to 35 or more feet. Producers of scissor hoists have had to meet the demands of lifting supplies with heavier cargo. Some manufacturers have introduced bigger capacity lifts that can be integrated into pick up trucks and vehicles like vans with height ranges of up to twenty feet and a capacity of 10,000lbs.

Normally seen in the lobbies of commercial buildings, the base unit lift truck are self-propelled scissor hoists. Normally, they are used in warehouses, hotels, business and commercial establishments. For example, maintenance cleaning of walls and hotel lobby halls would normally need lots of workers, and be a potentially dangerous and time consuming job to accomplish were it not for the availability of this indoor model of scissor lift. These indoor scissor lift truck types occupy minimum floor space and have a reach capacity of as much as thirty five feet. Used for interior building maintenance; these equipment with their extended reach capacity are designed to have minimum platform work space to be able to get to small-spaced corner areas of complex commercial buildings and hotel lobbies.

3. Helpful Features
The control panels of the self-propelled scissor forklift are at all times available to operators. Several of the newer units accessible today allow for an extendable platform. This allows the operator to extend or minimize their platforms in response to their workspace availability at different levels. This is a useful feature depending on whether the equipment is operated outside or inside.

Scissor hoists have extra options like platforms that are capable of withstanding additional weight and bigger platforms used for lifting. Producers of scissor lifts are now addressing the numerous requirements of several companies. For example, hotels and commercial buildings which have smaller entry halls together with highly elevated lobbies could use units with higher elevation capacities that are constructed to fit into narrower spaces. The platform work area is adjusted depending on the workspace available.

4. Moving Needs
For outside construction areas, there are models constructed which could travel in rough terrain. A few of these lifts are produced with cabin type platforms in order to allow the operator and platform user the ability to take their materials with them while working twenty feet above ground outside. Usually, with construction sites in an open space and outside environment, there may be the need to transport an entire office desk to an elevated level to be able to properly monitor construction activities. The scissor lift truck is the perfect tool to complete this job.
